Attachment A: Flow Frequency Memo and Fact Sheets for 303(d) Waters

MEMORANDUM

DEPARTMENT OF ENVIRONMENTAL QUALITY Piedmont Regional Office 4949-A Cox Road Glen Allen, Virginia 23060

SUBJECT: Flow Frequency Determination / 303(d) Status

Tyson Foods, Inc. - VA0004031

TO: Laura Galli

FROM: Jennifer Palmore, P.G.

DATE: January 28, 2014 **REVISED:** September 30, 2015

COPIES: File

The Tyson Foods, Inc. – Glen Allen facility discharges to an unnamed tributary of the Chickahominy River in Hanover County. The rivermiles are as follows:

Outfall 001: 2-XDD001.12 Outfall 002: 2-XDD000.95 Outfall 003: 2-XDD001.13

Flow frequencies have been requested for use in developing effluent limitations for the VPDES permit.

At the discharge points, the receiving stream is shown to be an intermittent stream on the USGS Glen Allen 7 ½' Quadrangle topographic map. The flow frequencies for intermittent tributaries are listed below:

Unnamed tributary at Outfalls 001, 002, and 003:

1Q30 = 0.0 MGD High Flow 1Q10 = 0.0 MGD 1Q10 = 0.0 MGD High Flow 7Q10 = 0.0 MGD 7Q10 = 0.0 MGD High Flow 30Q10 = 0.0 MGD

30Q10 = 0.0 MGD HM = 0.0 MGD

30Q5 = 0.0 MGD

Due to its intermittent nature, the receiving stream is considered a Tier 1 water. Effluent data should be used to characterize the stream during low flow conditions.

During the 2012 305(b)/303(d) Integrated Water Quality Assessment Report, the tributary below Tyson is considered a Category 5D water ("The Water Quality Standard is not attained where TMDLs for a pollutant(s) have been developed but one or more pollutants are still causing impairment requiring additional TMDL development.") The applicable fact sheets are attached. The stream was considered impaired of the Aquatic Life Use due to ammonia and pH exceedances, impaired benthic community, and low dissolved oxygen. The Wildlife Use was impaired due to the ammonia exceedances. The Fish Consumption Use was considered fully supporting with observed effects due to a VDH fish advisory for kepone, and the Recreation Use was not assessed.

In the draft 2014 Integrated Report, the stream is also considered Category 5A. The stream was considered impaired of the Aquatic Life Use due to ammonia and pH exceedances and an impaired benthic community. The Wildlife Use was impaired due to the ammonia exceedances. The Fish Consumption Use was considered fully supporting with observed effects due to a VDH fish advisory for kepone. The Recreation Use was not assessed.

Tyson was addressed in the report "Total Maximum Daily Load (TMDL) Development for the Unnamed Tributary to the Chickahominy River" which was approved by the EPA on 8/5/2004 and by the SWCB on 3/15/2005. The facility received a total phosphorus wasteload allocation of 409.35 lbs/year.

The Chickahominy River and Tributaries Bacterial TMDL was approved by the EPA on 9/19/2012 and by the SWCB on 3/25/2013. Tyson received an E. coli wasteload allocation of 2.18E+12 cfu/year.

The discharge was also addressed in the Chesapeake Bay TMDL, which was approved by the EPA on 12/29/2010. The TMDL allocates loads for total nitrogen, total phosphorus, and total suspended solids to protect the dissolved oxygen and submerged aquatic vegetation acreage criteria in the Chesapeake Bay and its tidal tributaries. Tyson Foods is considered a significant nutrient discharger and was included in the aggregated loads for significant wastewater dischargers in the Chickahominy River estuary (CHKOH). The nutrient allocations are administered through the Watershed Nutrient General Permit; the TSS allocations are considered aggregated and facilities with technology-based TSS limits are considered to be in conformance with the TMDL.

If you have any questions concerning this analysis, please let me know.

2014 Fact Sheets for 303(d) Waters

RIVER BASIN: James River Basin HYDROLOGIC UNIT: 02080206

STREAM NAME: Chickahominy River, UT - Unnamed Tributary

TMDL ID: G05R-01-BEN 2014 IMPAIRED AREA ID: VAP-G05R-01

ASSESSMENT CATEGORY: 4A TMDL DUE DATE: 2004

IMPAIRED SIZE: 1.17 - Miles Watershed: VAP-G05R

INITIAL LISTING: 1994

UPSTREAM LIMIT: Tyson Plant discharge

DOWNSTREAM LIMIT: Chickahominy River confluence

Segment consists of the unnamed tributary of the Chickahominy River to which the Tyson Plant discharges.

CLEAN WATER ACT GOAL AND USE SUPPORT:

Aquatic Life Use - Not Supporting

IMPAIRMENT: General Standard (Benthic), pH

Biological monitoring of the receiving stream identified a moderately impaired benthic community downstream of the Tyson Plant (VPDES Permit No. VA0004031) discharge when compared to the benthic community immediately upstream of the discharge. This resulted in this segment being assessed as impaired of the Clean Water Act's Aquatic Life Use Support Goal for the 1994 305(b) report. Continued monitoring resulted in a similar assessment for the 1996, 1998, 2002, and 2004 reports.

The TMDL study for the watershed was completed during the 2006 cycle. Extensive biological and nutrient monitoring was conducted. The benthic impairment continued and a pH impairment was noted at stations 2-XDD000.32 and 2-XDD000.40. The past phosphorus screening value was exceeded at multiple stations. The past chlorophyll A screening value was exceeded at 2-XDD000.40 and 2-XDD000.32 as well.

The TMDL was approved by the EPA on 8/05/2004 and by the SWCB on 3/15/05. The study attributed the benthic impairment to excess phosphorus and high pH. The allocation was 432.69 lbs/year of phosphorus, divided between Tysons Foods (409.35 lbs/yr) and nonpoint sources (23.34 lbs/year).

The segment remained impaired for benthics as well as pH during the 2014 cycle with an exceedance rate of 26/65 at 2-XDD000.40. and 31/64 at 2-XDD000.32.

IMPAIRMENT SOURCE Industrial Point Source, Nonpoint Source

The source of the impairment was attributed to excessive nutrient overenrichment.

RECOMMENDATION: Implementation

2014 Fact Sheets for 303(d) Waters

RIVER BASIN: James River Basin HYDROLOGIC UNIT: 02080206

STREAM NAME: Chickahominy River, UT - Unnamed Tributary

TMDL ID: G05R-01-NH3 2014 IMPAIRED AREA ID: VAP-G05R-01

ASSESSMENT CATEGORY: 5A TMDL DUE DATE: 2020

IMPAIRED SIZE: 1.17 - Miles Watershed: VAP-G05R

INITIAL LISTING: 2008

UPSTREAM LIMIT: Tyson Plant discharge

DOWNSTREAM LIMIT: Chickahominy River confluence

Segment consists of the unnamed tributary of the Chickahominy River to which the Tyson Plant discharges.

CLEAN WATER ACT GOAL AND USE SUPPORT:

Aquatic Life Use - Not Supporting, Wildlife Use - Not Supporting

IMPAIRMENT: Ammonia

Multiple exceedances of the chronic ammonia criteria had been noted in grab samples throughout the stream, therefore a special study was conducted in July 2005 to investigate the ammonia levels in the stream. Based on the results of the study, the segment was impaired for ammonia because of 6 acute ammonia exceedances each at 2-XDD000.84 and at 2-XDD000.91. A fish kill was noted in the pond.

Although there were no acute ammonia exceedances in the 2014 cycle, there were multiple chronic exceedances at 2-XDD000.32, 2-XDD000.40, 2-XDD000.84, and 2-XDD000.91. The impairment will be carried over this cycle, but continued monitoring is recommended.

IMPAIRMENT SOURCE Industrial Point Source

The source of the impairment is believed to be the Tysons Plant discharge.

RECOMMENDATION: Continue monitoring

2012 Fact Sheets for 303(d) Waters

RIVER BASIN: James River Basin HYDROLOGIC UNIT: 02080206

STREAM NAME: Chickahominy River, UT - Unnamed Tributary

TMDL ID: G05R-01-DO 2012 IMPAIRED AREA ID: VAP-G05R-01

ASSESSMENT CATEGORY: 5A TMDL DUE DATE: 2020

IMPAIRED SIZE: 1.15 - Miles Watershed: VAP-G05R

INITIAL LISTING: 2008

UPSTREAM LIMIT: Tyson Plant discharge

DOWNSTREAM LIMIT: Chickahominy River confluence

Segment consists of the unnamed tributary of the Chickahominy River to which the Tyson Plant discharges.

CLEAN WATER ACT GOAL AND USE SUPPORT:

Aquatic Life Use - Not Supporting

IMPAIRMENT: Dissolved Oxygen

The segment was assessed as not supporting of the Aquatic Life Use for dissolved oxygen due to an exceedance rate of 2/2 at 2-XDD000.65. Other stations in the segment have acceptable violation rates, therefore continued monitoring is recommended.

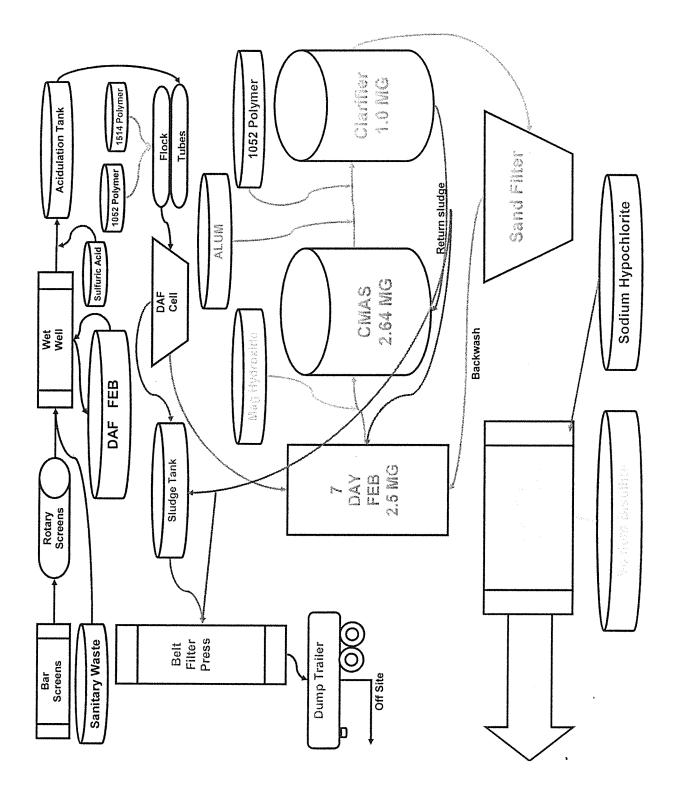

IMPAIRMENT SOURCE: Industrial Point Source

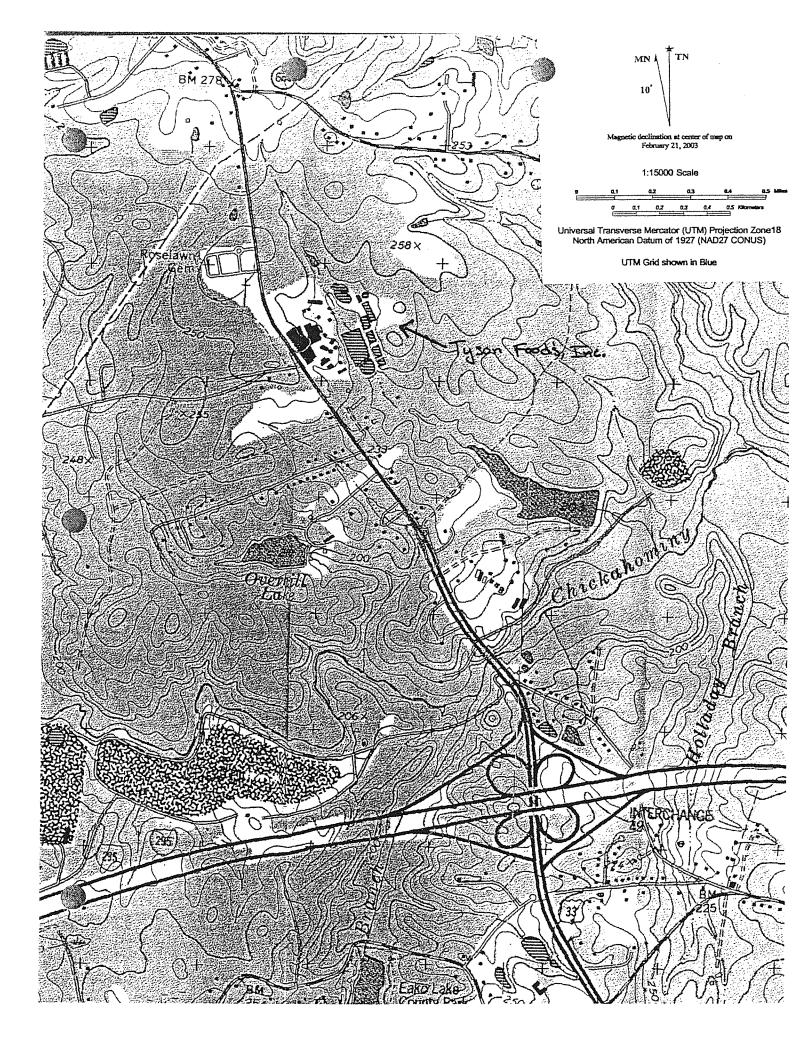

The source of the impairment is believed to be the Tysons Plant discharge.

RECOMMENDATION: Continue Monitoring

PRESENT DU	RING INSPECTIO	N: Austin Fren	ch and Tim Lockhart			

TECHNICAL INSPECTION

TECHNICAL INSPECTION		
1. Has there been any new construction?	▼ Yes	ΠNο
 If so, were plans and specifications approved? 		
Comments: Upgrade from a single stage activated sludge treatment system to a		
four stage Bardenpho BNR process along with the addition of a UV disinfection		
system.		
2. Is the Operations and Maintenance Manual approved and up-to-date?	▼ Yes	ΓNο
Comments: An O&M manual dated August 7, 2012 was reviewed as part of this		
inspection.		
3. Are the Permit and/or Operation and Maintenance Manual specified licensed operator	▼ Yes	ΓNο
being met?		
Comments: 1 class I operator; three employees are working on obtaining their		
class IV license.		
4. Are the Permit and/or Operation and Maintenance Manual specified operator staffing	▼ Yes	□ No
requirements being met?		
Comments:		
5. Is there an established and adequate program for training personnel?	▼ Yes	ΓNο
Comments: Training includes: DEQ's operator training books, Sacramento		
operator training books, and licensing prep classes at John Tyler CC.		
6. Are preventive maintenance task schedules being met?	▼ Yes	ΓNo
Comments: Minor maintenance is performed by plant personnel and more		
complex repairs (e.g. rebuilding a pump) are performed by contractors.		
7. Does the plant experience any organic or hydraulic overloading?	☐ Yes	₹ No
Comments:		
8. Have there been any bypassing or overflows since the last inspection?	▼ Yes	T No
Comments: On August 10, 2012, the facility received heavy rainfall which cause	i l	
an overflow in their sanitary wet well. An estimated 300 to 500 gallons was		
reported to have reached the wastewater effluent creek which discharges into a		
UT of the Chickahominy River. After investigating the incident, weekend pump	•	
settings were modified so that flows in the wet wells could be properly controlled	I	
during incidents of heavy rainfall.		

vactovator i domey inoposition i toport		0
9. Is the standby generator (including power transfer switch) operational and exercised regularly?	▼ Yes	ΠNο
Comments:		
10. Is the plant alarm system operational and tested regularly? <u>Comments:</u>	▼ Yes	ΓNο
11. Is sludge disposed of in accordance with the approved sludge management plan? <u>Comments:</u> Sludge from the belt press is transported to an off-site composting facility.	▼ Yes	I No
12. Is septage received? • If so, is septage loading controlled, and are appropriate records maintained? Comments:	T Yes	▽ No
13. Are all plant records (operational logs, equipment maintenance, industrial waste contributors, sampling and testing) available for review and are records adequate? Comments:	▼ Yes	l No
14. Which of the following records does the plant maintain?		
▼ Operational logs		
Mechanical equipment maintenance Industrial Waste Contribution (Municipal fac Comments:	ilities)	
15. What does the operational log contain?		
▼ Visual observations ▼ Flow Measurement ▼ Laboratory results ▼ Process adjust	stments	
Control calculations Cother (specify) Comments:		
16. What do the mechanical equipment records contain?		
As built plans and specs Manufacturers instructions Lubrication schedules		
Spare parts inventory		
Cother (specify)		
Comments:		
17. What do the industrial waste contribution records contain (Municipal only)?		
☐ Waste characteristics ☐ Impact on plant ☐ Locations and discharge types		
Other (specify)		
Comments: Not Applicable		
18. Which of the following records are kept at the plant and available to personnel?		
Equipment maintenance records Operational log Industrial contributor records		
✓ Instrumentation records ✓ Sampling and testing records Comments:		
19. List records not normally available to plant personnel and their location:		
Comments: None	-	·
20. Are the records maintained for the required time period (three or five years)?	▼ Yes	□No

Permit # VA0004031

7. General condition:				Good []	Fair	[] Poor		

Comments: The station receives screened process wastewater and storm water runoff (Offal loading area) and pumps to the pretreatment facilities. The station is subdivided – Wet Well #1 and Wet Well #2. Wet Well #1 is an open tank equipped with 2 pumps, two mechanical mixers, and an overflow portal to Wet Well #2. Wet Well #2 is a covered tank also equipped with 2 pumps. All four centrifugal pumps and alarm systems are activated by sonic level detectors. Pumps #1 and #2 pump from Wet Well #1 and pumps #3 and #4 pump from Wet Well #2.

After screening, all wastewater flow enters Wet Well #1. From there it is pumped to the pre-DAF Acidulation Tank. Overflows from Wet Well #1 go to Wet Well #2. Excessive flows to Wet Well #1 may be diverted to the DAF FEB to achieve equalized flow through the DAF unit. The contents of the DAF FEB gravity flow back to Wet Well #1. DAF effluent flows by gravity to Anoxic Reactor #1 (7-Day FEB).

	UNIT PROCESS: Flow Equalization "DAF FEB"

11.	General condition:		[] Good	[x] Fair	[] Poor				
Con	Comments: Wastewater is pumped from Wet Well #1 to the acidulation tank where sulfuric acid is added to bring								

Comments: Wastewater is pumped from Wet Well #1 to the acidulation tank where sulfuric acid is added to bring the pH to between 4.7 and 5.2 S.U. The acidulated wastewater enters flocculation tubes where cationic and anionic polymers are injected. The flocculated wastewater then enters the Dissolved Air Floatation (DAF) unit. Sulfuric acid is stored in a secondary contained tank which is outside and adjacent to the DAF building. Polymers are stored in the DAF building. Heavy particles settle down and are collected in the sludge cone and the floating floc is skimmed off of the top. Captured solids are transported to a rendering facility.

Comments: The 7-Day FEB was retrofitted into an anoxic reactor as part of the upgrade to the four stage Bardenpho biological nutrient removal (BNR) process. Mixing in the reactor is provided by 10, 7.5 HP floating mixers. For aeration, subsurface diffuser laterals are located on the bottom of the basin. It was noted that these diffusers are only turned on for one hour each night to exercise the blower and prevent the diffusers from filling up with water. The processing plant generally operates only 5 days per week, so the level in the basin increases during the week, and is drawn down on the weekend. In turn, the waste load at the WWTP is a little lighter on Monday after the weekend, and is heavier by the end of the week. Some accumulation of solids beneath the water surface along the perimeter of the basin was visible. Mr. French noted that solids slowly accumulate where the influence of the mixtures does not reach; solids that accumulate are periodically removed by a contractor. A magnetic flow meter measures flow from the reactor basin. A high liquid-level condition will alarm in the lab building. The 7-Day FEB receives flow from the DAF, Return Activated Sludge (RAS) from the clarifier, nitrate recycle from the Complete Mix Activated Sludge (CMAS) unit, domestic wastewater from the plant, and backwash water from the sand filters.

At the time of the inspection, the 7-Day FEB was receiving RAS at a rate of 1200 gallons per minute. The nitrate recycle from the CMAS back to the 7-Day FEB was 2500 gallons per minute.

Comments: The entire surface of the clarifier contained a layer of floating solids. Some trace amounts of suspended solids appeared to be in the effluent from the clarifier. At the time of the inspection, the skimming mechanism for the clarifier was not operating. Reportedly, the skimmer arm got caught on one of the scum troughs at the end of July, 2013 and damaged the system. The initial attempt to repair the system failed due to improper parts. It was reported that the skimming system should be repaired the week following this inspection. In a follow-up conversation with Mr. French on 10/2/2013, it was noted that the clarifier has not yet been repaired, but they anticipate the repairs occurring in the next week. Mr. French confirmed that they are not experiencing any issues with final effluent from the treatment process as a result of the problem with the clarifier. From the clarifier, flow is gravity fed to the tertiary sand filters which is likely preventing solids from entering effluent from the treatment plant.

	Diffuser?
	⊤ Yes ▼ No
2.	Are the outfall and supporting structures in good condition?
	▼ Yes □ No
3.	Final Effluent (evidence of following problems): None
	☐ Sludge bar ☐ Grease ☐ Turbid effluent ☐ Visible foam ☐ Unusual color ☐ Oil sheen
4.	Is there a visible effluent plume in the receiving stream? The receiving stream was not observed
	⊤Yes ⊤No
5.	Receiving stream: The receiving stream was not observed
	☐ No observed problems
	☐ Indication of problems (explain below)
	<u>Comments:</u> The receiving stream was not observed. Effluent from the treatment and effluent in the discharge channel that runs across the property was clear. Fish were observed in the discharge channel.

Permit # VA0004031

REQUEST for ACTION:

1. None

NOTES and COMMENTS:

- 1. The clarifier is in need of repairs. During the inspection, the surface of the clarifier was covered in floating solids. During a follow-up conversation with Mr. French on October, 2, 2013, this inspector inquired as to whether the clarifier had been repaired since the inspection. During that discussion, it was reported that the repairs should be completed sometime the following week. The presence of significant solids on the surface increases the potential for solids to enter the effluent leaving the clarifier. Increased solids flowing to the sand filters may decrease filtering capability. The clarifier does not appear to be operating in accordance with the operations and maintenance manual and should be repaired as soon as possible.
- 2. The sludge filter belt press was not operating at the time of the inspection due to mechanical problems. It was reported that wasting to the press occurs when the press is operational, but that the press is not consistently operational. During a follow-up conversation with Mr. French on October 2, 2013, the press had been operating successfully for the previous two weeks. It appears that the press could benefit from additional routine maintenance being performed to ensure that the press is available when needed.
- 3. A review of the VAN040089 General Permit for Total Nitrogen and Total Phosphorus Discharges discharge monitoring report for the July, 2013 monitoring period was performed as part of this inspection. Copies of the certificates of analysis from "Air Water and Soil Laboratories, Inc." for the July, 2013 monitoring period were reviewed and the nutrient loading calculations for July, 2013 were duplicated by this inspector. The nutrient discharge monitoring report for July, 2013 appears to be complete and accurate.
- 4. The waste sludge pond is no longer in service, so the facility depends on the belt press to be operating properly in order to waste sludge.

Permit # VA0004031

STORM WATER POLLUTION PREVENTION PLAN (SWPPP)

1.	Has a SWPPP been developed and implemented?	[x] Yes [] No
2.	Was the SWPPP, compliance inspection report, and other information available and is the S	WPPP current? [x] Yes [] No
3.	Contents must include: Pollution prevention team identification and responsibilities	[x] Yes [] No
	Description of potential pollutant sources must include: Detailed site drainage map Inventory of exposed materials	[x] Yes [] No

Measures and controls must include:

[x] Yes [] No

- Good housekeeping
- Preventive maintenance

Sampling data N/A

- Spill prevention and response procedures
- Routine inspections and visual exam of storm water samples plus documentation and follow up tracking and procedures
- Employee training
- Record keeping and internal reporting procedures

Updated list of spills and leaks of toxic or hazardous pollutants

Risk identification and summary of potential pollutant sources

- Sediment and erosion control
- · Management of run-off

Annual Comprehensive site compliance evaluation?

[x] Yes [] No

- Visual inspection of all areas contributing to a storm water discharge with industrial activity; evaluation of measures
 to reduce pollutant loadings; observing structural storm water management measures, sediment and erosion
 control measures, and other structural pollution prevention measures; visual inspection of equipment needed to
 implement the plan
- · Based on results of evaluation, revise SWPPP
- Compliance inspection report summarizing the scope of the evaluation, personnel making evaluation, dates of evaluation, major observations, actions taken, certification of compliance and signatory requirements met

Requirements for facilities subject to Emergency Planning and Community Right to Know Act (EPCRA) Section 313 [x] Yes [] No

Comments: The SWPPP was last updated on 1/7/2013 upon completion of the comprehensive site compliance evaluation that was completed on the same day. Quarterly visual monitoring for the first and second quarters of 2013 was reviewed during this inspection.

LABORATORY INSPECTION REQUEST for ACTION:

- 1. In May 2012, EPA issued a final rule to approve several new or revised analytical methods for measuring regulated pollutants in wastewater. This rule is also called the Methods Update Rule (MUR). One of the changes in this MUR is the naming convention used for citing Standard Methods. Citing the edition of Standard Methods is no longer applicable; now the citation must include the "date tag" in which the method was approved. Also note that for pH, D.O. and TRC, the 18th and 19th Editions of Standard Methods are no longer approved. Only the 20th, 21st and online Editions are approved. The current method citations are: D.O.: SM4500-O G -2001; pH: SM4500-H⁺ B -2000; TRC: SM4500-Cl G -2000 [This item is new guidance and does not require a response]
- 2. During the inspection, it was not determined if the thermistor present in the pH and D.O. meter is verified annually. The thermistor in the pH and D.O. meter should be verified against a NIST certified thermometer annually. No response to this item is required.
- 3. Initial Demonstration of Capability (IDC) must be completed by each operator who analyzes samples for pH, TRC, and D.O. This item is new guidance and was discussed during the inspection, so no response is necessary. Please see the enclosed forms for instructions. Please note that there are no specific credentials required for the witness involved with the IDC.
- 4. Three buffers should be used to perform the daily calibration of the pH meter. This item was discussed during the inspection so no response to this item is required.

NOTES and COMMENTS: None

ANALYST: Discussed with Austin French VPDES NO VA0004031	ANALYST:	Discussed with Austin French	VPDES NO	VA0004031
--	----------	------------------------------	----------	-----------

Meter: YSI 52

Parameter: Dissolved Oxygen

Method: Membrane Electrode

Facility Elevation: approximately240'

1/08

METHOD OF ANALYSIS:

Х	18 th Edition of Standard Methods – 4500-O G
	21st or Online Editions of Standard Methods – 4500-O G (01)

	DO is a method-defined analyte so modifications are not allowed. [40 CFR Part 136.6]	Υ	N
1)	Is a certificate of operator competence or initial demonstration of capability available for <u>each</u> <u>analyst/operator</u> performing this analysis? [SM 1020 B.1]		x
2)	If samples are collected, is collection carried out with a minimum of turbulence and air bubble formation and is the sample bottle allowed to overflow several times its volume? [1.c]	х	
3)	Are meter and electrode operable and providing consistent readings? [3]	Х	
4)	Is membrane in good condition without trapped air bubbles? [3.b]	Х	
5)	Is correct filling solution used in electrode? [Mfr.]	Х	
6)	Are water droplets shaken off the membrane prior to calibration? [Mfr.]	X	
7)	Is meter calibrated before use or at least daily? [Mfr. & Part 1020]	Х	
8)	Is calibration procedure performed according to manufacturer's instructions? [Mfr.]	Х	
9)	Is sample stirred during analysis? [Mfr.]	Х	
10)	Is the sample analysis procedure performed according to manufacturer's instructions? [Mfr.]	Х	
11)	Is meter stabilized before reading D.O.? [Mfr.]	Х	
12)	Is electrode stored according to manufacturer's instructions? [Mfr.]	Х	

PROBLEMS: An Initial Demonstration of Capability (IDC) needs to be completed. Mr. French believed that the meter was set to an elevation, but he was unable to confirm while onsite. The meter should be evaluated to confirm that it is set to the appropriate elevation for the facility. The approximate elevation for the facility as noted above is 240 feet. This elevation was noted on the inspection report for the inspection conducted on April 2, 2008.

Attachment D: Applicable Federal Effluent Limitation Guidelines

Subpart K—Poultry First Processing

§432.110 Applicability.

This part applies to discharges of process wastewater resulting from the slaughtering of poultry, further processing of poultry and rendering of material derived from slaughtered poultry. Process wastewater includes water from animal holding areas at these facilities.

§432.111 Special definitions.

For the purpose of this subpart: *Poultry first processing* means slaughtering of poultry and producing whole, halved, quarter or smaller meat cuts.

§432.112 Effluent limitations attainable by the application of the best practicable control technology currently available (BPT).

Except as provided in <u>40 CFR 125.30</u> through 125.32, any existing point source subject to this subpart that slaughters more than 100 million pounds per year (in units of LWK) must achieve the following effluent limitations representing the application of BPT:

Effluent Limitations

[BPT]

Regulated parameter	Maximum daily ¹	Maximum monthly avg. ¹
Ammonia (as N)	8.0	4.0
BOD_5	26	16
Fecal Coliform	(2)	(3)
O&G (as HEM)	14	8.0
TSS	30	20

¹mg/L (ppm).

§432.113 Effluent limitations attainable by the application of the best available technology economically achievable (BAT).

Except as provided in <u>40 CFR 125.30</u> through 125.32, any existing point source subject to this subpart that slaughters more than 100 million pounds per year (in units of LWK) must achieve the following effluent limitations representing the application of BAT:

Effluent Limitations

²Maximum of 400 MPN or CFU per 100 mL at any time.

³No maximum monthly average limitation.

[BAT]

Regulated parameter	Maximum daily ¹	Maximum monthly avg. ¹
Ammonia (as N)	8.0	4.0
Total Nitrogen	147	103

¹mg/L (ppm).

§432.114 Pretreatment standards for existing sources (PSES). [Reserved]

§432.115 New source performance standards (NSPS).

Any source that is a new source subject to this subpart must achieve the following performance standards:

(a) Facilities that slaughter no more than 100 million pounds per year (in units of LWK) must achieve the following performance standards:

Performance Standards

[NSPS]

Regulated parameter	Maximum daily ¹	Maximum monthly avg. ¹
Ammonia (as N)	8.0	4.0
BOD_5	26	16
Fecal Coliform	(²)	(3)
O&G (as HEM)	14	8.0
TSS	30	20

¹mg/L (ppm).

(b) Facilities that slaughter more than 100 million pounds per year (in units of LWK) must achieve the following performance standards:

Performance Standards

[NSPS]

Regulated	Maximum daily ¹	Maximum monthly avg. ¹
parameter	Maximum dany	waxiiiuiii iiioiitiiiy avg.

²Maximum of 400 MPN or CFU per 100 mL at any time.

³No maximum monthly average limitation.

Ammonia (as N)	8.0	4.0
BOD_5	26	16
Fecal Coliform	(²)	$\binom{3}{}$
O&G (as HEM)	14	8.0
TSS	30	20
Total Nitrogen	147	103

¹mg/L (ppm).

§432.116 Pretreatment standards for new sources (PSNS). [Reserved]

§432.117 Effluent limitations attainable by the application of the best control technology for conventional pollutants (BCT).

Except as provided in 40 CFR 125.30 through 125.32, any existing point source subject to this subpart must achieve the following effluent limitations representing the application of BCT: Limitations for BOD₅, TSS, O&G (as HEM), and fecal coliform are the same as the corresponding limitation specified in §432.112.

²Maximum of 400 MPN or CFU per 100 mL at any time.

³No maximum monthly average limitation.

| Signature of Principal Officer or Authorized Agent/Date

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment for knowing violations. See 18 U.S.C. Sec. 1001 and 33 U.S.C. Sec. 1319. (Penalties under these statutes may include fines up to \$10,000 and or maximum imprisonment of between 6 months and 5 years.)

FOOTNOTES:

(1) Quantification level (QL) is defined as the lowest concentration used for the calibration of a measurement system when the calibration is in accordance with the procedures published for the required method.

The quantification levels indicated for the metals are actually Specific Target Values developed for this permit. The Specific Target Value is the approximate value that may initiate a wasteload allocation analysis. Target values are not wasteload allocations or effluent limitations. The Specific Target Values are subject to change based on additional information such as hardness data, receiving stream flow, and design flows.

Units for the quantification level are micrograms/liter unless otherwise specified.

Quality control and quality assurance information shall be submitted to document that the required quantification level has been attained.

(2) Sample Type

G = Grab = An individual sample collected in less than 15 minutes. Substances specified with "grab" sample type shall only be collected as grabs. The permittee may analyze multiple grabs and report the average results provided that the individual grab results are also reported. For grab metals samples, the individual samples shall be filtered and preserved immediately upon collection.

C = Composite = A 24-hour (PW - Revise as required to require same composite duration as BOD₅) composite unless otherwise specified. The composite shall be a combination of individual samples, taken proportional to flow, obtained at hourly or smaller time intervals. The individual samples may be of equal volume for flows that do not vary by +/- 10 percent over a 24-hour period.

(3) A specific analytical method is not specified; however a target value for each metal has been established. An appropriate method to meet the target value shall be selected from the following list of EPA methods (or any approved method presented in 40 CFR Part 136). If the test result is less than the method QL, a "<[QL]" shall be reported where the actual analytical test QL is substituted for [QL].

<u>Metal</u>	Analytical Method
Antimony	1638; 1639
Arsenic	206.5; 1632
Chromium ⁽⁸⁾	1639
Cadmium	1637; 1638; 1639; 1640
Chromium VI	218.6; 1639
Copper	1638; 1640
Lead	1637; 1638; 1640
Mercury	245.7; 1631
Nickel	1638; 1639; 1640
Selenium	1638; 1639
Silver	1638
Zinc	1638; 1639
	. • ↓ [#] ₹

- (4) Any approved method presented in 40 CFR Part 136.
- (5) The QL is at the discretion of the permittee. For any substances addressed in 40 CFR Part 136, the permittee shall use one of the approved methods in 40 CFR Part 136.
- (6) Testing for phenols requires continuous extraction.
- (7) Analytical Methods: NBSR 85-3295 or DEQ's approved analysis for Tributyltin may also be used [See A Manual for the Analysis of Butyltins in Environmental Systems by the Virginia Institute of Marine Science, dated November 1996].
- (8) Both Chromium III and Chromium VI may be measured by the total chromium analysis. If the result of the total chromium analysis is less than or equal to the lesser of the Chromium III or Chromium VI method QL, the results for both Chromium III and Chromium VI can be reported as "<[QL]", where the actual analytical test QL is substituted for [QL].
- (9) The lab may use SW846 Method 8270D provided the lab has an Initial Demonstration of Capability, has passed a PT for Kepone, and meets the acceptance criteria for Kepone as given in Method 8270D
- (10) The sample type for Hardness (as CaCO₃) shall match the sample type selected for Dissolved Metals.

Notes:

- 1. All concentrations expressed as micrograms/liter (ug/l), unless noted otherwise
- 2. Discharge flow is highest monthly average or Form 2C maximum for Industries and design flow for Municipals
- 3. Metals measured as Dissolved, unless specified otherwise
- 4. "C" indicates a carcinogenic parameter
- Regular WLAs are mass balances (minus background concentration) using the % of stream flow entered above under Mixing Information. Antidegradation WLAs are based upon a complete mix.
- 6. Antideg. Baseline = (0.25(WQC background conc.) + background conc.) for acute and chronic
 - = (0.1(WQC background conc.) + background conc.) for human health
- 7. WLAs established at the following stream flows: 1Q10 for Acute, 30Q10 for Chronic Ammonia, 7Q10 for Other Chronic, 30Q5 for Non-carcinogens and Harmonic Mean for Carcinogens. To apply mixing ratios from a model set the stream flow equal to (mixing ratio 1), effluent flow equal to 1 and 100% mix.

The data are (mg/L): 168.6 150 130

Based on data submitted with the application, a new chloride limit is required based on chronic toxicity. However, because the limit is triggered with a limited set of data, and all data is below the WLAs, no limit is applied at this time. Monthly monitoring will be required over the course of the permit term and reasonable potential will be evaluated at the next reissuance.

The data are: 400 µg/L

A reasonable potential analysis was performed using hydrogen sulfide data reported on the permit application. Based on this analysis, a limit is needed. However, because the permittee has demonstrated that detections of this parameters derived from sampling errors, and subsequent sampling was undetected, no further sampling for this parameter will be required.

A reasonable potential analysis was performed for cadmium, which was reported as < 3.0 μ g/L on the reissuance application. The agency accepted QL for cadmium as 0.3 μ g/L. Therefore, for the purpose of this evaluation cadmium was considered present at a concentration equal to the lab QL of 3 μ g/L. The data provided in the March 25, 2015 report were below the agency QL, and are reported above as 0.

Attachment G: Groundwater Evaluation

MEMORANDUM

DEPARTMENT OF ENVIRONMENTAL QUALITY Piedmont Regional Office

4949-A Cox Road, Glen Allen, VA 23060-6296

804/527-5020

SUBJECT: Tyson Foods, Inc. - Groundwater Evaluation

TO: File

FROM: Janine Howard

DATE: January 27, 2014

Process and Background:

Tyson Foods, Inc. located on Mountain Road in Hanover County is a poultry processing plant, involving slaughter, cut-up, and packaging for human consumption as well as poultry processing for pet food production. The facility is permitted as a minor industrial discharger. The discharge results from the operation of a 1.5 million gallon per day wastewater treatment plant. Components of the treatment system include screening, acidulation, extended aeration, an activated sludge basin with suspended growth for ammonia removal, a four-stage Bardenpho system for biological nutrient removal, tertiary filtering, and ultraviolet disinfection.

Groundwater Monitoring:

There are four monitoring wells on site that are actively sampled (see attached groundwater contour map). Groundwater flows east through the property. MW-1 is the background well and is located north of the processing plant. MW-2, MW-3, and MW-4 are the downgradient wells that were put in place to monitor the groundwater impacts of the original treatment lagoons on site. The lagoons were constructed in 1968 east of the processing plant using on-site soils and were not lined. During the early 1990's groundwater contamination down-gradient of the treatment lagoons was observed in MW-2, MW-3, and MW-4. On April 4, 1992 a Lagoon Closure Plan (see attached) was submitted to and approved by DEQ. The plan involved a groundwater recovery network of wells used to remove contaminated groundwater from the area in addition to draining, sludge volume reduction and eventual revegetation of the lagoons.

The groundwater monitoring plan approved in 1990 requires quarterly groundwater monitoring. Additionally, indefinite quarterly monitoring of the wells was deemed necessary in the January 9, 1992 approval letter for the groundwater remediation plan for the facility. With the closure of the lagoons in 1992, natural attenuation of the contaminant levels in the groundwater is expected to occur over time until the groundwater meets standards.

Quarterly groundwater data was used for this evaluation, derived from sampling events from 2005-2013. See the contour map following this report which includes the approximate locations of all monitoring wells.

The parameters assessed are ammonia-N, biochemical oxygen demand (BOD), chloride, chemical oxygen demand (COD), nitrite, nitrate, sulfate, total dissolved solids (TDS), total kjeldahl nitrogen (TKN), pH, specific conductance, copper, sodium, and zinc. The data were evaluated for normality using the DEQ Piedmont Regional Office, Groundwater Analysis Spreadsheet which employs the Shapiro- Wilk Test of Normality. Non-normal data were assessed using a non-parametric test of significance (Wilcoxon Rank Sum Test), while normal data was assessed for a

significant difference using Cochran's approximation to the Behrens-Fisher Student's t-test with a 5% level of significance. The statewide groundwater standards applicable to this facility are listed in Table I. The facility falls in the Piedmont and Blue Ridge Physiographic Province for which there are also some specific standards and criteria. The results of the tests of significance are summarized in Table II below.

Table I. Groundwater criteria and individual monitoring well averages.

Parameter	Standard	MW-1	MW-2	MW-3	MW-4

Table II. Statistical difference between upgradient well (MW-1) and downgradient wells

Monitoring Well	Chloride	Nitrate	Nitrite	TKN	NH4	Zinc	Copper	BOD	COD	Sulfate	TDS	рН	Sodium	Sp. Cond
MW-2	S	NS	NS	S	S	S	NS	S	S	S	S	NS	S	S
MW-3	NS	NS	NS	NS	NS	NS	NS	NS	NS	NS	NS	S	NS	S
MW-4	NS	NS	NS	NS	NS	NS	NS	NS	NS	NS	NS	S	S	S

S= significant difference, NS= not significant

Chloride:

Statistical analysis of the chloride data indicated a significant difference in concentration at one of the three downgradient wells. Additionally, the majority of the data collected at the downgradient wells is above the groundwater criteria of 25 mg/L. Linear trends suggest a slight decrease in the

⁽²⁾Groundwater standards for the Piedmont & Blue Ridge Physiographic province (9 VAC 25-280-50)

⁽³⁾ Groundwater criteria for the Piedmont & Blue Ridge Physiographic province (9 VAC 25-280-70)

concentrations found at the downgradient MW-2 and MW-3 wells overall. MW-4 exhibits a slight positive trend.

Nitrate:

Downgradient nitrate concentrations were not significantly different from the background well. There are no exceedances of the groundwater standard documented in the groundwater data collected at MW-1, MW-2, MW-3, or MW-4 between March 2005 and February 2013.

Nitrite:

Downgradient nitrite concentrations were not statistically significantly different in the downgradient wells as compared to the upgradient well. There was a single exceedance of the 0.025 mg/L groundwater standard in MW-2 but the remainder of the data collected at all downgradient wells were below the standard.

TKN:

TKN does not have a groundwater standard or criteria. Each of the downgradient wells show elevated concentrations of TKN as compared to MW-1. The average TKN concentration at the upgradient well was 1.26 mg/L while MW-2, MW-3, and MW-4 had average concentrations of 2.54 mg/L, 77.7 mg/L, and 10 mg/L respectively. Overall the regression analysis indicates a weak negative trend in TKN levels at MW-1 and MW-3 and a weak positive trend at MW-2 and MW-4.

Ammonia:

Ammonia concentrations are considerably elevated above the groundwater standard at all of the downgradient wells. MW-2 and MW-3 exhibit a very weak upward trend, while MW-4 has a moderate negative trend.

Zinc

Zinc concentrations at MW-2 are statistically significantly greater than concentrations found at MW-1, the ambient well. However, the concentrations exhibit a decreasing trend and are below the standard with the exception of one data point. Zinc concentrations at MW-3 and MW-4 are also decreasing and are not significantly different from MW-1. The majority of the datapoints at MW-3 and MW-4 are below the standard.

Copper:

The data indicate no exceedances of the copper groundwater standard at any of the wells. Additionally, the concentrations at the downgradient wells are not significantly greater than those at the upgradient well.

BOD:

BOD does not have a groundwater standard or criterion. The BOD concentration data at the downgradient wells show a weak decreasing trend and with the exception of MW-2, there is no significant difference in the downgradient concentrations.

COD:

COD does not have a groundwater standard or criterion. There is no indication of contamination at MW-3 and MW-4. MW-2 does display a weak increasing trend in the COD concentrations in addition to the data being significantly different from that at MW-1.

<u>Sulfate</u>

The sulfate criterion for this facility is 25 mg/L. Seventeen of the nineteen datapoints at MW-2 are greater than the criterion, an indication of contamination. Additionally the data at MW-2 is significantly greater than that at MW-1. The difference between sulfate concentrations at the upgradient well and MW-3 and MW-4 is not significant. The majority of datapoints collected at MW-3 and MW-4 are well below the standard. There is a strong positive trend in concentrations at MW-2 and a slight increasing trend at MW-3.

TDS:

TDS concentrations in MW-2 are significantly elevated as compared to MW-1. TDS concentrations at MW-3 and MW-4 are not significantly different from those at MW-1.Most of the downgradient data is in excess of the 250 mg/L standard. The downgradient wells show moderate increasing trends in TDS concentrations, though the same trend is apparent at the upgradient well.

Sodium:

Sodium concentrations at the downgradient wells are all in excess of the criterion of 25 mg/L with the exception of one data point collected at MW-2. However, the concentrations do not exceed the statewide standard of 270 mg/L. Sodium concentrations at the background well are consistently below the criterion. MW-2 and MW-4 exhibit slight positive trends in sodium concentrations over time. MW-2 and MW-4 data is statistically significantly different than that at MW-1.

pH:

Downgradient pH levels show no significant elevations as compared to MW-1. Additionally, there are no excursions from the criterion at the downgradient wells.

Specific Conductance:

There is no groundwater criterion for specific conductance, however the parameter is an indicator of ions in the groundwater and is suggestive of the presence of other pollutants such as chlorides, nitrates, phosphates and sodium. As such, increased specific conductivity values are expected at wells where other parameters have been noted at elevated concentrations. All downgradient wells show significant elevations relative to MW-1. The regression analysis indicates a moderate decreasing trend in the conductance at MW-1, MW-2, and MW-4.

Conclusion:

The greatest level of impact relative to the up-gradient well appears to be at MW-2. MW-2 is located directly east of the former wastewater lagoons so this is to be expected. In general, ammonia, chlorides, BOD/COD, TDS, and sulfate appear to be the parameters of greatest concern. Concentrations of these pollutants are either present at levels greater than the standard/criterion or are found in concentrations in the downgradient wells that are statistically significantly greater than that at the up-gradient well. That being said, increasing trends in pollutant levels at the downgradient wells are weak and nonexistent in many instances. In some cases the pollutant levels are stagnant or may be decreasing slightly. The source of the contamination, the wastewater lagoons, have been closed and reclaimed. As such, it is anticipated that the groundwater contamination will naturally attenuate over time.

Certain parameters are consistently below the groundwater standard/criterion at the down-gradient wells. This is the case for nitrates, nitrites, zinc, and copper. The concentration of these parameters is also not significantly greater at the down-gradient wells (with the exception of zinc at MW-2).

Recommendation:

The lagoon closure plan approved in 1992 relies on removal of the source of contamination, groundwater remediation (pumping and treatment for one year following approval) and long term groundwater monitoring. Natural attenuation of the groundwater is expected over time. The greatest contamination is apparent in MW-2 which is located in closest proximity to the wastewater lagoons. MW-3 and MW-4 located west of the lagoons do not exhibit the same level of groundwater contamination, suggesting that the plume is localized.

Based on this evaluation it appears that contamination is still present for certain parameters but that some of the presently monitored parameters are no longer impacting the groundwater at the site. Since the facility is operating under a monitoring plan that is over 20 years old and may no

longer appropriately target groundwater concerns on the site, staff recommends a revised groundwater monitoring plan be developed. A revised groundwater monitoring plan may be incorporated into the permit via a special condition that requires submission of a revised plan within a certain timeframe following the permit reissuance.

LAGOON CLOSURE PLAN

FOR THE
TYSON FOODS, INC.
POULTRY PROCESSING PLANT
AT
GLEN ALLEN, VIRGINIA

APRIL 9, 1992

SUBMITTED BY REID ENGINEERING COMPANY, INC.

1211 CAROLINE STREET FREDERICKSBURG, VIRGINIA 22401 (703) 371-8500, FAX. (703) 371-8576

LAGOON CLOSURE PLAN

FOR

TYSON FOODS, INC. POULTRY PROCESSING PLANT

Glen Allen, VA

I. <u>INTRODUCTION</u>

This report presents a proposed closure plan for three (3) wastewater treatment lagoons at the Tyson Foods, Inc. Poultry Processing Plant in Glen Allen, VA. The closure plan and subsequent closure of the lagoons have been mandated by the Virginia Water Control Board. This report includes:

- * site description,
- * description of the proposed lagoon closure procedure,
- * post-closure maintenance plan,
- * proposed lagoon closure schedule.

II. DESCRIPTION OF SITE & EXISTING LAGOONS

The Tyson Foods, Inc. Poultry Processing Plant is located approximately 18 miles north west of Richmond, VA on Highway The plant was purchased by Holly Farms in 1963 for the processing of poultry products. The three (3) wastewater treatment lagoons to be closed were constructed in 1968 east of the plant facility to treat wastewater generated in the processing operation. The lagoons include one anaerobic lagoon (Lagoon No. 1) and two (2) unaerated lagoons for storage of waste activated sludge (Lagoon No. 3 and No. 4). The site is shown in Appendix I - Topographic Map of Lagoon Closure Area. The three (3) lagoons were constructed using on-site soils on the bottom and side slopes. At the time of construction, these soils were not tested for compaction or permeability. The effectiveness of these soils in preventing leakage is, therefore, questionable. Groundwater monitoring data gathered by Tyson Foods, Inc. in 1990 and 1991, indicates concentrations of certain pollutants to be elevated above background groundwater quality levels. Use of these lagoons will be discontinued after proposed improvements to the wastewater treatment system are completed in late 1992. system of groundwater collection wells and well pumps will also be installed in 1992 to achieve groundwater remediation to background levels.

Sludge thickness measurements and sampling have also been performed in each lagoon. As shown in Appendix II, Lagoon

Sludge Accumulation Measurements, approximately 16.0 feet (259,000 ft³) of accumulated sludge presently exists in sludge storage Lagoon No. 3 which is filled with solids. Approximately 1.5 feet of sludge (12,100 ft³) exists on the bottom sludge storage Lagoon No. 4 which has a total depth of 12.5 feet. Approximately 16.0 feet of accumulated bottom sludge and floating solids (300,000 ft³) are present in existing Anaerobic Lagoon #1 which is filled with solids.

Testing of a representative composite sample of the sludge in each lagoon was performed and the results are enclosed in Appendix IV, Report of Laboratory Analysis of Accumulated Sludge Solids.

III. DESCRIPTION OF PROPOSED LAGOON CLOSURE PROCEDURE

The closure of the three lagoons at the Tyson Foods, Glen Allen, VA treatment plant site will be accomplished with sludge materials in place in the following steps:

- 1. After the proposed treatment system upgrade is completed and on-line, discontinue input of wastewater into the existing anaerobic lagoon and input of sludge into the two existing sludge lagoons.
- 2. The two existing 12" diameter inlet pipes into existing Anaerobic Lagoon #1 will be abandoned and plugged with concrete. The existing 4" diameter pipe inlets into Lagoons #3 and #4 will be abandoned and plugged with concrete. The existing 6" diameter overflow pipe from Lagoons #3 into Lagoon #5 will be abandoned and plugged with concrete. The 4" diameter sludge waste force main to Lagoons #3 and #4 will be plugged downstream of the tee connection and inlet control valve to the proposed new waste sludge lagoon and the old force main pipe to Lagoons #3 and #4 will be abandoned.
- 3. Gradually pump out liquid wastewater from all three lagoons into the treatment system for ultimate disposal; and, continue to pump out collected rainwater from the lagoons into the treatment system for ultimate disposal as necessary in the future.
- 4. Optionally pump out accumulated solids from each of the lagoons by a commercial sludge disposal company for ultimate disposal by land application on VA SWCB approved sites.
- 5. Regularly seed accumulated solids in the lagoons with commercially purchased Byo-Gon biological life activator (See Appendix V Byo-Gon Activator Information) to attempt to accelerate the reduction of accumulated sludge solids volume by endogenous respiration.

- 6. Continue to monitor the quality of groundwater collected in the recovery wells, by analyzing on a quarterly frequency, samples pumped from the groundwater remediation recovery well system until groundwater pollutant levels are either reduced to background levels or to relatively stable levels which do not cause groundwater quality to be at risk.
- 7. Continue to monitor the levels of accumulated sludge in each lagoon to observe sludge volume reduction from endogenous respiration accomplished by dosage of Byo-Gon activator.

IV. POST CLOSURE MAINTENANCE PLAN

This proposed "materials in place" lagoon closure plan is not a "clean close" grade over plan but is essentially a long term lagoon management plan. This lagoon closure or management plan is especially suitable when accomplished simultaneously with the proposed Groundwater Remediation Plan in which groundwater will be collected, tested and recycled to the Tyson Foods, Glen Allen treatment plant for ultimate disposal.

This lagoon closure plan is proposed based on the assumption that discontinuing operation of these lagoons combined with lagoon solids volume reduction and lagoon supernatant disposal will eliminate further potential seepage of pollutants into the groundwater. This closure goal will be confirmed by ongoing groundwater sampling and testing during the Groundwater Remediation Phase coupled with the backup protection of the groundwater collection, pumping, treatment, and disposal plan.

V. PROPOSED LAGOON CLOSURE SCHEDULE

·	EVENT	DATE
1.	Complete construction and start-up of Groundwater Remediation Well System and begin initial groundwater collection phase prior to elimination of Operation of unlined treatment lagoons.	Aug. 15, 1992
2.	Complete construction of treatment	
	plant upgrade and eliminate operation of unlined treatment lagoons.	March 15, 1993
3.	Commence liquid waste pump-out from the lagoons into the upgraded wastewater treatment system.	June 15, 1993
4.	Complete optional pump-out of accumu- lated solids from lagoon by commercial sludge disposal company.	Sept. 15, 1993
5.	Commence Byo-Gon activator dosage to reduce residual sludge volumes in lagoons.	April 1, 1994
6.	Discontinue Byo-Gon activator dosage into the lagoons.	April 1, 1995
7.	Monitor residual sludge characterisctics and accumulated sludge depths on each lagoon and pump out rainwater from lagoons to treatment system.	Commence on April 1, 1994 continue into future as required by VA SWCB

RE: Tyson Foods, Inc., Glen Allen, Virginia Ground Water Remediation Plan

Dear Mr. Reid:

The staff of the State Water Control Board has reviewed the supplement dated October 21. 1991 to the ground water remediation plan for Tyson Foods, Glen Allen. The proposed abatement procedures are technically adequate and the plan is approved subject to the following conditions:

- 1. Please confirm the pumping schedule for the recovery wells. The January 14, 1991 plan indicated that pumping was to be continuous at a rate of approximately 24 gallons per minute (2 the recovery wells are to be pumped 24 hours per day, 7 days per week.
- 2. All monitoring reports are to be submitted by the tenth of the month following the monitoring period.
- An annual status report is required in January 1993 and yearly thereafter, if necessary. A completion report is also required.
- 4. Regarding Appendix 3 -- Ground Water Remediation Plan Implementation Schedule, the monitoring following abatement must be done at least monthly for a period of 6 months. The perpetual monitoring, if needed, must be done on a quarterly hasis.
- 5. The ground water monitoring program approved in March 1990 requires quarterly monitoring for a more comprehensive list of constituents than the indicator parameters cited in the October 21 submittal. The quarterly monitoring required by the March 1990 approval must continue. That monitoring will

Page 2 Mr. John H. Reid Tyson Foods, Inc., Glen Allen January 9, 1992

also satisfy the needs of the abatement plan when the sample times coincide.

- A Lagoon Closure Plan will be submitted for review and approval by February 14, 1992.
- 7. We reserve the right to require additional site assessment and site characterization if the need for such work is identified during the abatement program.

Please contact Ray Jenkins (527-5037) or B. N. Sinha (527-5054) if you have any questions.

Sincerely.

Gerard Seelev. Jr.

Regional Director

SUBJECT:

TYSON FOODS, INC., GLEN ALLEN, VIRGINIA

GROUNDWATER REMEDIATION PLAN

Dear Ray:

As you requested in our meeting on September 25, 1991 concerning the proposed Tyson Foods, Glen Allen, Virginia groundwater remediation plan, this letter and attached groundwater contour map, aquifer analysis, and implementation schedule are submitted to the State Water Control Board to provide the additional information that you requested during our meeting.

As requested by Dr. Sinha, a groundwater contour map has been prepared and is attached in Appendix #1. This groundwater contour map clearly indicates a south to southeasterly flow of groundwater under the existing lagoons. This groundwater contour map also indicates that, at present, the unnamed tributary stream at the south end of the Glen Allen processing plant site is the present final discharge point for groundwater flow under the existing lagoons. The proposed groundwater remediation plan will call for the installation of twelve groundwater recovery wells across the south end of the new treatment plant site. Proper operation of this groundwater recovery-remediation system will result in elimination of contaminated groundwater flow into the unnamed tributary stream.

Mr. Ray Jenkins, Jr. Virginia State Water Control Board October 21, 1991 Page 2

As emphasized by Mr. Bill Barker, hydrogeologist for Tyson Foods on this project, because the hydraulic gradient of the shallow groundwater slopes and flows toward the surface water in the unnamed tributary from both the North and South sides of the tributary, the present extent of groundwater contamination should be limited to the groundwater on the North side of the unnamed tributary stream and the stream flow itself. Also, because of the original topography of the site prior to construction of the treatment ponds, contaminant migration is unlikely East and West of the pond sites. Before construction of the ponds a large drainage swale existed directing runoff toward the unnamed tributary. This stream should be eliminated by the proposed groundwater remediation plan.

As requested by Dr. Sinha, the groundwater remediation plan will be revised to use only existing upgradient Monitoring Well #1 as an indicator well for background groundwater quality.

As requested by Dr. Sinha, aquifer analysis including determinations of hydraulic gradient, hydraulic conductivity, transitivity and storativity are provided in Appendix #2. These analyses have been prepared by Mr. Bill Barker, P.G., Consulting Hydrogeologist for Tyson Foods, Inc. As noted in the discussion in Appendix #2 prepared by Mr. Barker, this hydrogeologic information indicates that the proposed recovery well system should be able to collect 100% of the groundwater flow from under the treatment plant lagoon site to the unnamed tributary located at the South boundary of the Tyson Foods processing site.

As requested, Reid Engineering Company has prepared a proposed Groundwater Remediation Plan Implementation Schedule which is contained in Appendix #3. Please be advised that this implementation schedule has used available hydrogeologic data for the Glen Allen site to prepare a rough estimate that approximately 15 months will be required from the time that wastewater inflow into the existing unlined treatment lagoons is eliminated to the point in time where the proposed groundwater collection and treatment program has resulted in the elimination of the entrance of further pollutants into the groundwater flow and the production of groundwater quality equal to the background quality of upgradient Monitoring Well #1. The proposed groundwater remediation plan contains the following four phases:

Mr. Ray Jenkins, Jr. Virginia State Water Control Board October 21, 1991 Page 3

- Initial groundwater collection and pumping phase prior to elimination of operation of existing unlined waste treatment lagoons.
- Groundwater remediation phase after new treatment system improvements are operational and further operation of existing unlined waste treatment lagoons is eliminated.
- 3. Post remediation phase with reduced groundwater monitoring schedule.
- 4. Perpetual monitoring phase with periodic groundwater monitoring.

As agreed in our meeting, the following parameters will be tested as indicator pollutants in the groundwater samples taken from MW #1, 2, 3 & 4 during all phases of the remediation plan:

Ammonia TKN TDS Specific Conductivity pH Zinc

One composite sample of the combined pumped groundwater flow will also be obtained from the proposed new groundwater collection manhole for testing.

Reid Engineering Company will be submitting a Lagoon Closure Plan for the Glen Allen site to the State Water Control Board by mid December. As you noted in our meeting, the requirement for a Perpetual Monitoring Phase at the end of the remediation work will depend upon the closure method proposed by Tyson Foods, Inc. in the Lagoon Closure Plan.

As noted by Mike Motsinger, assistant processing plant manager at Glen Allen, Tyson Foods desires to obtain expedited approval of the proposed groundwater remediation plan from the Virginia State Water Control Board so that they can proceed with the installation and operation of the groundwater remediation recovery wells to improve groundwater quality as rapidly as possible. Tyson Foods desires to eliminate the seepage of contaminants from the existing

Mr. Ray Jenkins, Jr. Virginia State Water Control Board October 21, 1991 Page 4

unlined lagoons; contain existing groundwater flow; and eliminate any negative effects of groundwater flow on receiving stream water quality by implementation and start-up of this groundwater collection, pumping and remediation plan by January 1, 1992 as noted on the proposed implementation schedule.

If you have questions or need additional information please

Best Regards,

REID ENGINEERING COMPANY, INC.

John H. Reid, P.E. President

Attachment H: Whole Effluent Toxicity Evaluation

MEMORANDUM

DEPARTMENT OF ENVIRONMENTAL QUALITY Piedmont Regional Office

4949-A Cox Road, Glen Allen, VA 23060-6296804/527-5020

SUBJECT: VA0004031 Tyson Farms, Inc. – Updated Toxicity Evaluation

TO: File

FROM: Janine Howard

DATE: January 15, 2015, updated March 16, 2015, updated August 10, 2015

Background: On October 1, 2014 DEQ staff met with Tyson representatives to discuss the draft permit package that was distributed to Tyson for owner review on August 25, 2014. Tyson expressed concern that the TMP Data Evaluation dated December 1, 2010, from which the new chronic toxicity limit was derived, was out of date and utilized data that was no longer representative of the facility's effluent quality. DEQ agreed to rerun the statistical analysis on the toxicity data using more recent data. All data that was available from 2009 to present was compiled and utilized for the updated evaluation.

Data Summary:

Table 1. Results of Chronic Toxicity Tests using Ceriodaphnia dubia

As was the case during the 2010 evaluation, statistical evaluation of both species test end points resulted in limitation recommendations based on chronic toxicity. All of the NOEC test results for *P. promelas* were greater than the compliance endpoint in the previous permit, and thus reasonable potential for the toxicity of the discharge to this vertebrate species has not been demonstrated. In accordance with DEQ's earlier determination (see 12/1/2010 TMP memo), a limitation will not be based on these test results.

Due to the historic results where the NOEC fell below the compliance endpoint in the 2005 permit on multiple occasions, and a lack of newer data to demonstrate that the effluent toxicity has improved, a *C. dubia* limitation is again recommended for the permit reissuance. This is consistent with the earlier decision made in 2010 to include a chronic toxicity limit for *C. dubia* in the reissuance (see 12/1/10 memo).

A limitation recommendation of $TU_C = 1.12$ will be required in this permit reissuance.

Recommendation: In accordance with TMP Guidance 2000 (DEQ Guidance Memo No. 00-2012), data evaluation, and best professional judgment, it was determined that: 1) the facility continue conducting quarterly chronic toxicity tests (Chronic 3-Brood Static Renewal Survival and Reproduction Test using C. dubia until the WET limit is effective, and 2) a new WET limitation of NOEC = 89% and $TU_C = 1.12$ be established for C. dubia with a 4 year compliance schedule.

Refer to the 12/1/2010 TMP memorandum for the proposed permit language.

SUBJECT: TMP Data Evaluation and Review for Tyson Foods/Tyson Farms, VA0004031

COPIES: File

Permit Number:

Facility Name: Tyson Farms, Inc. DBA Tyson Foods, Inc. – Glen Allen

Complex VA0004031 2.067 MGD

Maximum 30-day Effluent Flow: 2.067 MGD Design Flow: 1.25 MGD

Receiving Stream: UT to Chickahominy River Instream Waste Concentration (IWC): 100%

Facility SIC: 2015

Facility Description:

The Tyson Foods – Glen Allen Complex is processed as an industrial minor facility. The industrial discharge consists of treated wastewater resulting from the operations at a poultry processing facility (slaughter, meat cut preparations, packaging for human consumption and poultry processing for pet food), facility cleaning operations, and facility domestic sanitary waste.

Facility Requirements:

The current permit (expired November 13, 2010) requires quarterly Whole Effluent Toxicity (WET) testing (Chronic 3-Brood Static Renewal Survival and Reproduction Test, *Ceriodaphnia dubia* in odd numbered years) and (Chronic 7-Day Static Renewal Survival and Growth Test, *Pimephales promelas* in even numbered years). The special condition set the criteria of NOEC = 69% or TU_C of 1.44.

Data Summary:

This data review includes the results of 11 and 10 sets of quarterly testing for each of *Ceriodaphnia dubia* and *Pimephales promelas*, respectively. Testing was performed by Meritech, Inc. (2005 to 2007) and then Coastal Bioanalysts, Inc. (2007 to 2010). All tests were conducted in accordance with approved protocol.

Results of Chronic Toxicity Tests using Ceriodaphnia dubia

Discussion:

Statistical data evaluation was performed using STATS.exe. The test endpoints used in the data evaluation were the lowest NOEC's (converted to TU_C) reported for each of the paired chronic tests performed on a specific date. These test endpoints were consistently the reproduction TU_C in C. dubia and growth TU_C in P. promelas. STATS.exe results are listed below.

Chronic averaging period = 4 WLAa = 3 WLAC = 1 Q.L. = 1 # samples/mo. = 1 # samples/wk. = 1 Summary of Statistics: # observations = 11 Expected Value = 1.48973 Variance = 0.540259 C.V. = 0.493393 Variance = 1.74215 # < Q.L. = 0 Model used el lognormal A limit is needed based on Chronic Toxicity Maximum Daily Limit = 1.40692274293467 Average Weekly limit = 1.40692274293467 Average Weekly limit = 1.40692274293467 The data (TU _C) are:	Chemical = WET - TU _C (<i>C. dubia</i>)	Chemical = WET - TU _C (<i>P. promelas</i>)

Statistical evaluation of both species test end points resulted in limitation recommendations based on chronic toxicity. Toxicity of the discharge to C. dubia has been demonstrated and a limitation recommendation of NOEC = 72% and TU_C = 1.38 will be required in this permit reissuance. All of the 10 NOEC test results for P. promelas were greater than the compliance endpoint in the previous permit, and thus reasonable potential for the toxicity of the discharge to this vertebrate species has not been demonstrated. One of the test results reported was less than the chronic NOEC of 100% (reported as 83%). Using best professional judgment, a limitation will not be based on these test results.

Recommendations:

In accordance with TMP Guidance 2000 (DEQ Guidance Memo No. 00-2012), data evaluation, and best professional judgment, it was determined that: 1) the facility continue conducting quarterly chronic toxicity tests (Chronic 3-Brood Static Renewal Survival and Reproduction Test using *C. dubia* until the WET limit

is effective 2) a new WET limitation of NOEC = 72% and $TU_C = 1.38$ be established for *C. dubia* with a 4 year compliance schedule.

(1) WET testing permit section to be included in current permit reissuance is as follows:

C. WHOLE EFFLUENT TOXICITY (WET) LIMITATION REQUIREMENTS

- 1. The Whole Effluent Toxicity limitation of ≤1.38 TU_C (NOEC≥72%) in Part I.A. is a final limit with an effective date of 4 years from the effective date of this permit.
- 2. Commencing within the first month after the effective date of the limit, the permittee shall conduct quarterly Chronic 3-Brood Static Renewal Survival and Reproduction Tests using *Ceriodaphnia dubia* using 24-hour flow-proportioned composite samples of final effluent from outfall 001.

These chronic tests shall be conducted in such a manner and at sufficient dilutions (minimum of five dilutions, derived geometrically) to determine the "No Observed Effect Concentration" (NOEC) for survival and reproduction. The test endpoint (72%) must be represented by a dilution, and if other than 100%, should be bracketed by at least one dilution above and one dilution below it. Results which cannot be determined (i.e., a "less than" NOEC value) are not acceptable, and a retest will have to be performed. A retest of a non-acceptable test must be performed during the same compliance period as the test it is replacing. Express the test NOEC as TU_c (Chronic Toxic Units), by dividing 100/NOEC for DMR reporting. The IC_{25} should be included on the submitted test reports. A copy of the toxicity test results shall be submitted with the DMR. Test procedures and reporting shall be in accordance with the WET testing methods cited in 40 CFR 136.3.

- 3. The permit may be modified or revoked and reissued to include pollutant specific limits in lieu of a WET limit should it be demonstrated that toxicity is due to specific parameters.
- 4. The permittee shall report the results on the quarterly DMR and submit a copy of each toxicity test report in accordance with the following schedule:

Test Period	Test Period Dates	DMR/Report Due Date
Quarter 1	Jan 1 – March 31, 2011	Apr 10, 2011
Quarter 2	Apr 1 – Jun 30, 2011	Jul 10, 2011

Quarter 19	Jul 1 – Sep 30, 2015	Oct 10, 2015
Quarter 20	Oct 1 – Dec 31, 2015	Jan 10, 2016

(2) WET testing permit section to be included in current permit reissuance is as follows:

D. WHOLE EFFLUENT TOXICITY (WET) MONITORING REQUIREMENTS

- Within the first quarter after the effective date of the permit, the permittee shall conduct quarterly chronic toxicity tests on Outfall 001 using 24-hour flow-proportioned composite samples until the WET limit of Part 1.A. is effective. The test to use is the Chronic 3-Brood Survival and Reproduction Static Renewal Test using *Ceriodaphnia dubia*.
- 2. These chronic tests shall be conducted in such a manner and at sufficient dilutions (minimum of five dilutions, derived geometrically) to determine the "No Observed Effect Concentration" (NOEC) for survival and reproduction. Results which cannot be quantified (i.e., a "less than" NOEC value) are not acceptable, and a retest will have to be performed. A retest of a non-acceptable test must be performed during the same compliance period as the .test it is replacing. Express the test NOEC as TU_c (Chronic Toxic Units), by dividing 100/NOEC for DMR reporting. Report the LC₅₀ at 48 hours and the IC₂₅ with the NOEC in the test report.

The permittee may provide additional samples to address data variability. These data shall be reported and may be included in the evaluation of effluent toxicity. Test procedures and reporting shall be in accordance with the WET testing methods cited in 40 CFR 136.3.

3. The test dilutions should be able to determine compliance with the following endpoints:

Chronic NOEC of ≥72% equivalent to a TU_C of ≤1.38

- 4. The permit may be modified or revoked and reissued to include pollutant specific limits in lieu of a WET limit should it be demonstrated that toxicity is due to specific parameters. The pollutant specific limits must control the toxicity of the effluent.
- 5. The permittee shall report the results on the quarterly DMR and submit a copy of each toxicity test report in accordance with the following schedule:

Test Period	Test Period Dates	DMR/Report Due Date
Quarter 1	Jan 1 – Mar 31, 2011	Apr 10, 2011
Quarter 2	Apr 1 – Jun 30, 2011	Jul 10, 2011

Quarter 17	Jan 1 – Mar 31, 2015	Apr 10, 2015
Quarter 18	Apr 1 – Jun 30, 2015	Jul 10, 2015
Quarter 19	Jul 1 – Sep 30, 2015	Oct 10, 2015
Quarter 20	Oct 1 – Dec 31, 2015	Jan 10, 2016

(3) Part I.A. section to be included in current permit reissuance is as follows:

A. LIMITATIONS AND MONITORING REQUIREMENTS

- 1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from Outfall **001**.
- a. Such discharges shall be limited and monitored by the permittee as specified below:

		DISCHARO	SE LIMITS		MONITOR REQUIREN	
EFFLUENT CHARACTERISTICS	MONTHLY AVERAGE	WEEKLY AVERAGE	MINIMUM	MAXIMUM	FREQUENCY	SAMPLE TYPE
720 Toxicity, Chronic (TU _C)[C.dubia] ⁽¹⁾ (Interim)	NA	NA	NA	NA	1/Quarter	24 HC
720 Toxicity, Chronic (TU _C)[C.dubia] ⁽²⁾⁽³⁾ (Final)	NA	NA	NA	1.38	1/Quarter	24 HC

NA = Not Applicable 24HC = 2

24HC = 24-Hour Composite

Notes:

- (1) See Part I.D. for monitoring requirements for Whole Effluent Toxicity.
- (2) See Part I.C. for limit requirements for Whole Effluent Toxicity.
- (3) See Part I.B.X. for Schedule of Compliance.
- (3) Part I.B.X section to be included in current permit reissuance is as follows:

B.X. COMPLIANCE SCHEDULE FOR CHRONIC WHOLE EFFLUENT TOXICITY LIMIT

The permittee shall achieve compliance with the final limit for Chronic Whole Effluent Toxicity as specified in Part I.A.1 in this permit in accordance with the following schedule:

	SCHEDULE OF COMPLIANCE FOR CHI	RONIC WHOE EFFLUENT TOXICITY
1.	Prepare progress reports.	Annually beginning 1 year from the permit effective date.
2.	Achieve compliance with the final effluent limitation for Final Chronic Whole Effluent Toxicity.	No later than 4 years from the permit effective date.

No later than 14 calendar days following the dates identified in the above schedules of compliance, the permittee shall submit to the Piedmont Regional Office, either a report of progress or, in the case of specific actions being required by identified dates, a written notice of compliance or noncompliance. In the latter case, the notice shall include the cause of noncompliance, any remedial actions taken, and the probability of meeting the next scheduled requirement.

Mr. Tim Lockhart EHS Manager **Tyson Foods – Glen Allen Complex** 13264 Mountain Road Glen Allen, VA 23059

RE: Stormwater Flow Evaluation Report
Tyson Foods Glen Allen Complex
Cardno Project TF001

Dear Mr. Lockhart:

Per your request Cardno is pleased to provide this report describing our stormwater flow evaluation for the referenced Facility. The purpose of the evaluation was to review the Facility's permitted storm water flows with respect to the potential for contacting or mixing with the plant's process water. The scope of services, as originally outlined in our January 23, 2015 proposal, included the following tasks:

- Compile a map of storm water watersheds and drainage patterns across the entire site based on aerial photography, publically-available LIDAR topographic survey data and client-provided information;
- 2. Inventory, describe and document storm water sources within each watershed; and,
- 3. Document the absence of contact between storm water and process water flows.

The work performed and findings for each task are described herein.

Information Review

The following data sources were reviewed for this project:

- 1. http://www.hanovercountygis.org/ (GIS Topography);
- 2. January 15, 2014 Facility Stormwater Pollution Prevention Plan (SWPPP);
- Sheet M2, Drainage Areas, Site Plan and Erosion & Sediment Control Plan, Reid Engineering circa 1992 (SWM Map); and,
- 4. May 7, 2015 site visit (Site Visit).

The information collected was used to compile the two attached maps; Water Management Site Plan (Figure 1), and Water Management Site Plan Insets (Figure 2).

Storm Water Management Mapping

GIS Topography suggests that storm water drains to a central surface water feature that crosses

Cardno, Inc.

10988 Richardson Road Ashland, VA 23005 USA

Phone +1 804 798 6525 Fax +1 804 798 5907 www.cardno.com

www.cardno.com

the Site from north to south, with some storm flow directed to a drainage way located along the southern boundary, as illustrated on **Figure 1**. The central drainage feature is identified in the SWPPP as an unnamed tributary to the Chickahominy River. These general conditions were confirmed during the Site Visit.

The Facility's SWPPP describes seven (7) areas for the purposes of storm water management. These are identified as:

- Area 1 Employee Parking/Front Office Parking
- Area 2 Live Receiving/Pet Food Loading/Wet Dock
- Area 3 Pet Food Refrigeration/Hydraulic Room/Boiler Room/Offal Room/Maintenance Shop/Maintenance Shed/Pallet Storage Shed/Chemical Storage Shed/Drummed Petroleum Storage Area
- Area 4 Main Plant Refrigeration/Shipping and Labeling
- Area 5 Service Center/Fueling Bay/Wash Bay/Pump House
- Area 6 Wastewater Treatment Plant (WWTP)
- Area 7 Live Holding Shed/Chicken Trailer Staging/Remote Trailer Parking

The extents of each area were illustrated on the SWM Map listed as reference 3, and are shown on Figure 1.

In general, storm water flow within each SWM area is either directed to flow to collection points for treatment prior to discharge, or directed to flow directly to a surface water feature. The SWM management systems include structures that collect stormwater and direct it to the process water piping system for treatment at the WWTP, a bioretention cell (BMP-14) to treat stormwater prior to discharge to surface water, and a stormwater pipe network that discharges directly to surface water.

Regarding the stormwater structures that transmit storm water to the process water treatment system, it is our understanding that these inverts are normally open to receive storm water flow. Further, it is our understanding that BMP-12 located in Area 2, remote trailer parking, may be covered for brief periods of time in advance of hurricane storm conditions.

These features and SWM for each area are illustrated on Figures 1 and 2, and are summarized below.

<u>Area 1</u>

Stormwater from the employee parking area is directed to a drop inlet (DI-3) where it enters storm sewer piping that discharges to the central surface water feature to the east. Stormwater from the front office parking area is directed to DI-1, where it enters process water piping for treatment by the WWTP. Storm water from these areas is considered to be non-contact water with respect to Facility processes.

Area 2

Area 2 includes Live Receiving/Wet Dock operational activities where live, or unprocessed product is handled on the north side of the Facility as shown on **Figure 1**. A close up of this area is shown on **Figure 2**, **Inset 1**. Storm water that falls on these activities is collected by DI-2, DI-9, Pit Pump and trench drain (BMP-5) where it enters the process water piping network for treatment at the WWTP.

In the parking area beyond the loading/receiving docks, storm water is directed to flow to a bioretention cell (BMP-14) for treatment prior to discharge to surface water. BMP-14 was constructed to manage potential incidental contact with fecal residue that might occur as delivery trucks are moved through the area.

Mr. Tim Lockhart Page 3

Area 3

Storm water in Area 3 does not come in contact with unprocessed product. Storm water in this area is directed to DI-5, DI-10 and/or wet wells 1 and 2 (WW-1 &2), where it enters the process water pipe network for treatment by the WWTP.

Area 4

Storm water in Area 4 does not come in contact with unprocessed product. Storm water in this area is directed to DI-15A-15B-15C or to DI-13 where it enters the storm sewer piping prior to discharge to surface water.

Area 5

Storm water in Area 5 does not come in contact with unprocessed product. Storm water in this area is directed to DI-12 or to the east where it discharges to surface water.

Area 6

Storm water in Area 6 falls on the WWTP operations area, does not come in contact with unprocessed product. Storm water in this area either falls directly into self-contained treatment units where it enters the treatment process or it falls on non-contact areas where it discharges to surface water.

Area 7

Area 7 includes the live holding shed/chicken trailer staging and remote trailer parking areas, where stormwater could come in contact with unprocessed product or iced product drippings. Close-ups of these areas are shown on **Figure 2**. Insets 2 and 3.

At the remote trailer parking area, stormwater is directed to a sloped concrete pad with invert (BMP-14), where it enters the process water system and is treated by the WWTP.

At the live holding shed, live product trailers are parked under roof so as to not be in contact with stormwater. Drips and fecal matter falling from the trailers are directed via sloped concrete pad to a central trench drain (BMP-12) where the flow enters the process water piping and treatment system and is treated by the WWTP.

In the area to the south of the shed, storm water is directed toward BMP-14 (bioretention cell) where it is treated prior to discharge to surface water. BMP-14 was constructed to manage potential incidental contact with fecal residue that might occur as delivery trucks are moved through the area.

Evaluation of Contact Potential

The following observations are made with respect to the potential for stormwater to be exposed to fecal matter and/or E. coli bacteria that originate from Facility activities under normal operating conditions:

- Of the seven SWM areas, only Areas 2 and 7 exhibit conditions where storm water flow could come in contact with bacteria originating from Facility operations.
- For Area 2, all storm water that falls on the product handling area is directed to storm water structures that
 connect to process water piping for treatment at the Facility WWTP. Storm water that falls outside of the
 product handling area is directed to BMP-14 for treatment by the bioretention cell.
- For Area 7, storm water that falls on product handling areas is either isolated from the process by a roofing system, or is collected and directed to the process water system for treatment at the WWTP. Storm water that falls outside of the product handling area where live product delivery trucks are moved is directed to BMP-14 for treatment by the bioretention cell.

Based on evaluation the information presented herein, it is our opinion that stormwater coming in contact with fecal matter and/or E. coli originating from normal Facility operations does not discharge directly to surface water, but rather is collected by stormwater management structures and delivered to the process water system for treatment by the Facility WWTP.

Cardno is pleased to be of service to Tyson Foods. If you have any questions or require additional information, please contact us at 804-798-6525 or at eric.powers@cardno.com.

Freq.	1/ Month^	1/Week	1/6 months	1/3 Months	1/Month***	1/2 Months	1/Month∞	1/6 Months	1/Week	1/2 months	3/Week~	1/Day	1/Day

The DMR data from January - April 2015 has been omitted from this evaluation. During the time the plant experienced an upset due to the presence of freshwater snails in the treatment plant in large numbers. DEQ agreed to disregard the effluent data reported during this period for the purpose of the reduced monitoring evaluation due to the extraordinary circumstance.

- ^ Based on performance, BOD monitoring frequency would be eligible to a reduction of 1 / 2 Months. However, because BOD is an operational parameter, monitoring frequency is reduced to 1/Month based on PWJ.
- *** TN year-to-date applied per GM 07-2008 Amendment 2. Reduced frequency not available
- ** Reduced monitoring for pH considered on a case by case basis. Per the 2014 VPDES permit manual, reduced monitoring of pH is not granted where min or max pHs fall within 0.5 units of the permit limits. Throughout the last three years the minimum pH has fallen within 0.5 units of the 6.00 SU limit (highlighted in red) on many occasions. For this reason a reduction in the monitoring frequency for pH is not recommended.
- » E. coli monitoring frequency will remain at 1/Week due to UV disinfection system replacing chlorination in 2010.

Frequency in accordance with section IN-2 of 2014 VPDES permit manual

- ∞ Reduced monitoring frequency for settleable solids is based on permit writer judgment due to all results being reported as <QL.
- ~ Reduced monitoring frequency for DO eligible on PWJ as the facility does not provide active aeration; formula applied for reduced frequency as follows: (1-((DO avg DO limit)/DO limit)*100

Attachment M: Owner Comments and DEQ Response to Comments

Document/ Page	Language	Comment	DEQ Responses
Stormwater	Bacteria monitoring.	How is the engineering study insufficient?	The engineering study states that in Area 7 "stormwater is directed toward BMP-14 where it is treated prior to discharge to surface water. BMP-14 was constructed to manage potential incidental contact with fecal residue that might occur as delivery trucks are moved through the area." Consequently, there is potential for bacteria contributions to stormwater from the facility operations. A reduced monitoring frequency of 1/6 months will be assigned in recognition of minimal potential for contact. If bacteria concentrations in excess of the benchmark are measured, updates to the SWPPP may address source isolation sampling and existing BMPs in place to minimize potential for contact with the industrial operation.
Fact sheet page 6 of 25	"As was the case during the 2010 evaluation, statistical evaluation of both species test end points resulted in limitation recommendations based on chronic toxicity." Guidance Memo 00-2012, data evaluation, and permit writer judgment.	We need to better understand the rationale for the new WET limitations	As promised, I verified with Deborah DeBiasi that a limitation is appropriate for the reissuance. Additional data was provided by Tim Lockhart and used in the evaluation. Consequently, the limitation has been revised from 1.38 TUc to 1.12 TUc. As indicated in the permit, we are providing a 4 year schedule of compliance to allow for the operational and potential capital upgrades needed. While we discussed the option for Tyson to request a modification prior to the close of the compliance schedule in order to remove the limitation, in the absence of a conclusive argument that the existing data is no longer representative, the need for a limitation is not likely to change.
Permit Section I, Table	720 – Toxicity	We need to better understand the rationale for the toxicity limitation expressed.	As explained, the toxicity limitation is based on reasonable potential for the effluent to cause toxicity to aquatic life. Because in stream mixing is not available, any toxicity observed in the effluent triggers the need for a limitation. Toxicity was observed in 4 separate sampling events.
Fact Sheet Page 8 of 25	Hydrogen Sulfide – Annual monitoring only	Sampling is not warranted or required. Results submitted March 15, 2015, show non-detect concentrations for total sulfide.	We have received documentation of sample collection errors for the initial results indicating the presence of H2S. Consequently, we have omitted the data and further sampling under the permit is not required.
VPDES Permit, p. 22 of 24, 15 and Sec. D	Hydrogen Sulfides Minimization Plan	Need to understand the rationale for inclusion.	In accordance with the response above, this condition has been removed.

Summary of Owner Comments and DEQ Response to Comments – Conference Call July 2015

Fact Sheet Page 6 of 25, Permit Part I(D)?	145 – Chlorides	Need to understand the rationale for inclusion of testing based on the worksheet model for toxicity.	While the reasonable potential analysis triggers a limitation, DEQ recognizes that a limitation may not be necessary with a larger data set. The existing data is well below the WLA. Consequently, monthly monitoring will be required over the course of the permit term and reasonable potential will be evaluated at the next reissuance.
VPDES Permit, Part I	002 – pH 1/day 007 – DO 1/day	Why are these not 1/week as with similar analytes (see 004 TSS)	These are operational parameters and it is standard practice to require a baseline of 1/day monitoring frequency.
VPDES Permit, p. 22 of 24, Sec. D	Schedule of Compliance for Chlorides and WET	Need to understand the rationale for inclusion.	Chlorides will be removed from the Compliance Schedule. The schedule will be retained for the WET limitation to allow the facility time to make any operational changes or capital upgrades needed to comply with the limitation.
	012 – TP limits 794 – TP limits	Need rationale for expressions of TP as written	As explained during the conference call, and further in the FS, each of the TP limits is required by regulation. Although the loading limitation in the IP is equal to the Nutrient Trading GP loading, the GP is not protective of the Chickahominy TMDL, on which the IP limitation is based. Because the Nutrient GP allows for trading, a firm limitation is included in the IP to protect the Chickahominy TMDL.
	071 – Settleable Solids	This plant has a tertiary filter and the limitation should be removed or at least reduced to quarterly.	As discussed, the monitoring frequency has been adjusted to once per month for Settleable Solids.
VPDES Permit, Part I, Sec. 7	Compliance Reporting	Verify that if the level is below QL, then report a zero or "QL." See page 20, 7(c).	As stated in the permit, "All concentration data below the QL used for the analysis shall be treated as zero."
VPDES Permit, Part I, Sec. 13	Effluent Monitoring Frequencies	Baseline monitoring with no reversion possible for permit term?	This is a standard condition that is applied consistently when the privilege of reduced monitoring is granted in the permit. The condition requires that if an NOV is issued for any of the parameters, all monitoring frequencies revert to baseline until the evaluation is conducted again at permit reissuance. At your request, we have revisited the baseline frequencies and made adjustments consistent with previous permits.
		Define "grab" or "in situ" samples	Michael Terry coordinated with the Compliance Manager in the Piedmont Regional Office and she resolved his concerns. Grab samples will be required in the permit
Fact Sheet, Page 6 of 25	Zinc	Need to understand the rationale for inclusion.	Reasonable potential was demonstrated in the evaluation presented in the FS.

Summary of Owner Comments and DEQ Response to Comments – Conference Call July 2015

Fact Sheet, Page 8 of 25	Chlorine (TRC)		While chlorine is not used as a disinfection method at the facility, a TRC special condition is included to allow for emergency needs for chlorine disinfection. The condition has been revised to remove the TRC residual requirements within the contact tank.
Fact Sheet, Page 8 of 25	Design Flow	1.07 MGD design flow vs. 1.25 MGD	This reference has been removed from the FS.

Ms. Emilee Adamson Virginia Department of Environmental Quality Piedmont Regional Office 4949-A Cox Road Glen Allen, Virginia 23060

Re: Requested information from the subject facility:

Tyson Glen Allen Plant VPDES Permit No. VA0004031

Dear Ms. Adamson,

Tyson greatly appreciates your time and consideration during pre-draft reviews of the above referenced permit. Following the conference call on July 20, 2015 please accept the following information in response to inquiries concerning 1) name change on Permit, 2) rationale to exclude Hydrogen Sulfide as a permit parameter, and 3) rationale to reduced monitoring for Dissolved Oxygen.

1) Owner Name:

The official owner & facility name is: Tyson Farms, Inc.

2) Elimination of Hydrogen Sulfide as permit reissuance parameter:

As was discussed on the conference call, the 2010 sample submission was collected at the wastewater facility employees not familiar with protocols associated with sampling for such sensitive parameters. Tyson requested DEQ to allow for additional samples to be performed by qualified 3rd party agents. The result of the additional testing indicated non-detection of any dissolved hydrogen sulfide. In addition, the current wastewater process, chemical program, waste activated sludge handling, equipment and management thereof has changed significantly since 2010.

3) Reduced Dissolved Oxygen monitoring:

The decision to not allow a reduced dissolved oxygen monitoring schedule may have been based on the presence of a non-passive post aeration system listed in the DEQ's documentation. This was the case in June 2010 at the time of the permit application submittal, however in December 2010 the installation of the UV disinfection system was completed along with other system changes eliminating the need and use of non-passive post aeration system.

If you have any questions or require additional information please contact me at 798.8357 ext 305 or at tim.lockhart@tyson.com

Sincerely,

TYSON FOODS, INC.

Tim Lockhart

Mr. Dale Mullen McGuire Woods LLP 901 East Cary Street Richmond, VA 23219-4030

Re: Tyson Farms, Inc. Glen Allen Plant Draft Permit # VA0004031

Dear Mr. Mullen,

The Department of Environmental Quality (the Department) has received your letter dated April 22, 2015 and the subsequent engineering analysis received June 19, 2015, for the subject facility, and provides the following comments:

- 1. As discussed during the October 1, 2015 meeting with the facility, Department staff has performed a monitoring frequency reduction analysis for all parameters. Please see Attachment L of the fact sheet for the calculations of the final monitoring frequencies that will be included in the Permit, and the respective rationales. Please note that data reported in the DMRs from January to April, 2014 were not included in the analysis following explanation that the facility had experienced an upset due to the presence of freshwater snails in the treatment plant.
- 2. The Department has reevaluated the monitoring requirements for *E.coli* at Outfall 001. With a baseline monitoring frequency of 5 days per week, as recommended by GM14-2003 for a plant with a design capacity of 1.25 MGD and a maximum 30-day average flow of 1.0 MGD, the Department has calculated a monitoring frequency of 1 per week for the 2015 permit.
- 3. The additional two sampling data provided in the March 25, 2015 report were incorporated in the Reasonable Potential Analyses (RPA) for cadmium, selenium, zinc, and chloride. The analyses results show that no limitation is required for cadmium, selenium and zinc. The RPA for chloride shows the need for a limitation based on chronic toxicity. Because this is a new limitation, a four-year schedule of compliance will be included in the permit. Despite the RPA for zinc showed no limitations needed for zinc, the 2005 limitation will be carried forward to the 2015 permit to avoid non compliance with antibacksliding regulation.
- 4. The Department is willing to eliminate the hydrogen sulfide special condition from the draft permit. However, annual monitoring for dissolved sulfide will be required in the permit unless the permittee can provide a justification of why the initial concentration of 400 ug/L is no longer representative of the effluent. Please note that any further monitoring would be required in the permit and will not be allowed prior to reissuance.

- 5. The permittee expressed concern that the TMP Data Evaluation dated December 1, 2010, from which the new chronic toxicity limit was derived, was out of date and utilized data that was no longer representative of the facility's effluent quality. DEQ agreed to rerun the statistical analysis on the toxicity data using more recent data. All data that was available from 2009 to present was compiled and utilized for the updated evaluation. As was the case during the 2010 evaluation, statistical evaluation of both species test end points resulted in limitation recommendations based on chronic toxicity. In accordance with Guidance Memo 00-2012, data evaluation, and permit writer judgment, it was determined that: 1) the facility continue conducting quarterly chronic toxicity tests (Chronic 3-Brood Static Renewal Survival and Reproduction Test using *C. dubia* until the WET limit is effective and 2) a new WET limitation of NOEC = 72% and TUC = 1.38 be established for *C. dubia* with a 4 year compliance schedule. Also please note that because the facility has to comply with a WET limit, monitoring frequency reduction is not allowed, and therefore no language for frequency reduction will be included in the permit.
- 6. The Department believes that the concentration units for total nitrogen and total phosphorus as reported in Part I.A of the draft permit are consistent with the reporting requirements. The daily maximum units for total phosphorus and total nitrogen are expressed in kg/year versus kg/day because the facility has Total Nitrogen and Total Phosphorus calendar year load limits associated with Outfall 001 as included in the 2012 Registration List, under registration number VAN040089 (see footnote 9 in Part I.A of the permit). The calendar year load limit for total phosphorus in the permit has been converted from lbs/year to kg/year. Please refer to special conditions I.C.12 and I.C.13 for nutrients reporting requirements. While it may seem confusing initially, the inclusion of several different nutrient reporting parameters (i.e. annual average, year-to-date average, etc.) is necessary to meet the regulatory requirements of 9VAC25-40-70 and 9VAC25-31-220.L. This presentation is consistent in all permits discharging to the Chesapeake Bay.
- 7. The Department has reviewed the Stormwater Flow Evaluation Report dated June 10, 2015, and provides the following comments:
 - a. Figure 1 shows the presence of a basin named BMP-4. Please provide a description of the functionality of the basin in relation to the stormwater flows that it receives from the several SWM areas on site, and in relation to the bioretention cell BMP-14.
 - b. Based on the report and maps provided, it is unclear where the treated process wastewater and the stormwater flow collected by the drainage channel are discharged. Our records indicate that the point of compliance for Outfall 002 (stormwater) is prior to the point at which the wastewater treatment plant effluent and the stormwater mix. Hence, the stormwater samples are not comingled with treated process wastewaters. Please provide a description and the locations of the points of discharge for both Outfall 001 and 002.
 - c. The stormwater report mentions that the stormwater runoff comes in contact with unprocessed product in only two drainage areas (area 2 and area 7), and that in both cases stormwater is treated, by the wastewater treatment plant (area 2) or bioretention cell (BMP-14, area 7) prior to being piped to the WWTP. However, the report also mentions that part of the stormwater that is directed to BMP-14 is then directly discharged to surface waters. In addition, the Department has some reservations with respect to the conclusion that only area 2 and area 7 have the potential of direct contact with bacteria; specifically, it appears that area 5, described as a service center with fueling and washing activities, may have the potential to carry bacteria.

Unless the permittee is able to demonstrate that: 1) no stormwater runoff that has been in contact with unprocessed product or incidental chicken waste from transport activities is directly discharged to surface waters; 2) the washing and rinsing activities in area 5 do not have the potential for stormwater to come in contact with livestock bacteria; the

VPDES Permit No. VA0004031 Page 3 of 3

Department believes that continued monitoring for *E. Coli* in the stormwater at Outfall 002 is appropriate.

Given the limited potential for contact with bacteria from the process activities, we are willing to reduce the bacteria monitoring from once per quarter to semiannual.

Please provide a response to the comments above within 14 days of receipt of this letter. Should you have any questions regarding any of the comments above, please contact me at 804-527-5095, or laura.galli@deq.virginia.gov.

Sincerely,

Laura Galli

Laura Galli VPDES Permit Writer Virginia Department of Environmental Quality Piedmont Regional Office 4949-A Cox Road Glen Allen, VA 23060

Re: Tyson Farms, Inc. Glen Allen Plant Draft Permit # VA0004031

Dear Laura:

In response to your email of April 2, 2015, we offer the following details regarding the draft permit, similar to the conversations we had at our October meeting.

DEQ has indicated a willingness to evaluate the monitoring frequency requirements for a number of parameters. These generally fall into two categories. The first are parameters where the monitoring frequency was based, in part, on data collected during upset conditions at the plant due to the presence of freshwater snails. This includes TSS and BOD which had elevated levels during the upset, which ran from approximately January 2014 through April 2014.

The second category was parameters which had an extremely limited number of samples, some of which included limits of detection that were too high for the parameter. In support of lowering the sampling, or eliminating the limit altogether, we submitted the additional data you received a few weeks ago for total sulfides, chlorides, selenium, cadmium and zinc.

Tyson also feels that the Hydrogen Sulfide Minimization Plan in the current draft is unnecessary. The recent data provided to DEQ reflects no detectable levels of total sulfides in the plant's wastewater. However, if the Department feels it is necessary, Tyson can conduct additional analyses specific to Hydrogen Sulfide to support removal of this permit condition.

As noted previously, we would like to reduce or eliminate the monitoring requirement for E. coli and fecal coliform at Outfall 2. The current data at the storm water outfall show fecal coliform above the screening value of 28 N/cmL, with results ranging up to 1,600 N/cmL. It is our opinion that the source of the fecal coliform is natural given the wildlife present in the stormwater retention pond and outfall stream. Our basis for this is that (1) there is no indication of significant levels of fecal coliform or E. coli in the process water at Outfall 1, and (2) there is no other potential source of these contaminants on site. We will support this through an engineering review of plant operations. The storm water drainage map (Attachment J to the Fact Sheet) shows that 40% of the plant area, including all of the parking surfaces where birds

Laura Galli April 22, 2015 Page 2

are temporarily stored before being processed, drain not to the stormwater outfall, but instead are captured and fed into the wastewater treatment system on site. Thus, the engineering review will show that any fecal coliform or E. coli present at the stormwater outfall are the result of wildlife at the rural facility. Given this, Tyson does not feel that the monitoring requirements at Outfall 2 are necessary or appropriate. We expect that engineering analysis will be available for submission to the Department not later than Friday, May 8, 2015.

We would also like to reduce the monitoring requirements for E. coli at Outfall 1. The current increased frequency for monitoring based on the conversion to UV disinfection appears to be overly burdensome. The frequency appears to be based, in part, on the design flow of the plant, which is roughly 1.25 MGD. However, average flows at the plant are significantly lower, running at roughly 0.7-0.75 MGD on average. In addition, several systems are in place to ensure that the UV system provides the necessary disinfection, including a back-up bank of UV lights, and mandatory shut-down of operations should the UV system fail.

The current draft permit also includes additional chlorine limitations. While Tyson does not object to having the limits, should use of chlorine for disinfection on an emergency basis be necessary, we would request a slight change to the wording in this section to clarify that it would only apply during such intermittent use. The first sentence should read "If chlorine is used as a disinfection method (instead of ultraviolet), TRC shall be limited and monitored by the permittee as specified below from the time of initial utilization and continued until termination of use plus 7 days:"

Tyson also questions the necessity of the new requirement for toxicity testing in the draft permit. Our evaluation of the WET testing data shows that a single outlier data point from January of 2007 may be driving this requirement. Tyson believes that evaluation of the newer WET testing data from 2009 to present will show that the data from January 2007 is an outlier as all more recent testing showed 100% survival and good reproduction. In addition, Tyson would like to discuss the possibility of future reductions in WET testing frequency should the data continue to show little to no toxicity. For instance, Tyson has provisions in similar permits which reduce WET testing to an annual basis if four straight quarters show no lethal or sublethal effects.

Tyson also asks that DEQ utilize simplified (consistent units) limits for Nitrogen and Phosphorus in the revised permit. The draft permit includes multiple expressions of permit limits for these parameters, which may result in confusion when determining the appropriate sampling times and reporting of results.

This is merely a summary of the issues we have identified to date. We would like to reserve the opportunity to review and comment on subsequent draft documents before a subsequent draft is issued for public notice, we ask that we be allowed to discuss these points with you at an early opportunity. We expect that engineering analysis regarding stormwater, and additional WET testing will be available for submission to the Department not later than Friday, May 8, 2015.
